

PARASHER-1 (10944*1)

Abstract of the Disclosure

A probe vibrating assembly for endoscopic procedures includes a base unit having a rotatable spindle. A drive member is eccentrically mounted to the spindle. The drive unit is secured to a slide plate to move the slide plate back and forth while the spindle is rotating. A clamp mechanism is secured to the slide plate and is used for clamping a probe so that the probe also moves back and forth. The probe is mounted to a medical scope.
